No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the cotal score distribution.

Age-related gene regulation; liver-specific; gene expression; human factor IX; hBY; ABS', AB3', age-regulatable expression construct; antiesnee therapy, gene therapy; thrombosis; cardiovascular disease; diabetes; Alzheimer's disease; Parkinson's disease; cancer; osteoporosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 expression in an age-related manner and/or in a layer-specific manner. The invention identifies regions of the human factor IX (NETX) gene, an a region of the human process (NPC) gene, which are age-related a regulatory sequences in the NETX age-related regulatory sequences are designated ABS (AAPS 6106) and ABS (AAPS 4019) and are found in the S' UTX (at position 2164-2165 of AAPS 4019) and are found in the S' 3485-3565 of AAPS 4018) respectively. These elements act synergistically
                                                                                                            The invention relates to a single exon nucleic acid probe for measuring human gene expression in a smalle derived from human foetal laver. The single exon nucleic acid probes may be used for predicting measuring and displaying gene expression in samples derived from human feetal liver. The present sequence in a peptide encoded by a single exon nucleic-acid probe of the invention.

Mote: The sequence date for this patent did not form part of the printed specification, but was obtained in electronic forme directly.
                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to nucleic acid sequences which regulate gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New regulatory elements that control age-related gene expression, useful in gene therapy and for reducing Factor IX expression
                Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human fetal liver

                                                                                                                                                                                                                                                                                          the inventors claim a vector which comprises a DNA SQ coding for factor IX (FIX) and elements providing expression of this SQ in host calls. The prepn. of DNA FIX is as £0110-ws. Polyadenylared mRNA is 18018cd from humen lives, used to make ss-DNA which X1. St gressed with S1 and the fragments over 1 kD cloned in pRN 321. Clones are selected by Mystrdiamiton with a 52-mer probe corresp. to the bowine factor IX SQ (AAND0562).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The factor IX coding SQ (AANS0351) is first inserted into a non-
sesential region of viral DNA, cloned in a batterial plasmid. A
double-reciprocal recombination procedure is then used to transfer
the insert into the viral genome where it is propagated and
                                                                                                                                                                                   Cloning and expression vector for factor nine - for transforming

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The inventors claim a recombinant DNA having a human factor IX sequence pref. at least 26 nucleotides long, esp. 75-7000 nucleotides. A cloning vector contg. foreign BNA is also claimed. The foreign sequence pref. includes the whole of an exon sequence of the foreign sequence pref. includes the whole of an exon sequence of the human factor IX genome. The cloning vehicle may be a modified comprising a DNA melacule having a single or double stranded probe sequence of is to 10000 nucleotides long factor IX DNA sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Prodn. of artificial human factor IX - by use of recombinant DNA sequences for host transformation and cultivation

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The inventors claim vectors for expressing factor IX, or an analogous procein in vertebrate cells which consist of the genome poxylitus into which a gene coding for factor IX or an analogous procein has been inserted. Outlivation of infected cells produces very pure factor IX (a deficiency of which causes haemophilia B).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    S X S X X X X X S X L X X
                                                                                                                                                                                                                                                                                                                                                                     This sequence represents a human feator IX processe. This procein is used in the construction of a noval non-glycosylated procein and truncated and symbol forms of this protein, which have settler procease activity. The procein is composed of various domains from a feator IX family procein. The procein is composed of various forms from a feator IX family procein. The procein is composed of various forms of the procein and procein from a feator IX family proceins of the procein forms of the procein from the procein in ZDD, which incomes feator IX family proceins (posterially useful as required to consider the procein in zymogen form is also useful. In assays for descripting factor IX and scrivity in equence solution (specifically in bod description). The procein in zymogen form is also useful as the procein in zymogen form is also useful as with proceins of an inhibitors for X-ray structural analysis and drug modelling and a brestition prices or inhibitors for X-ray structural analysis and drug modelling where has an especificative as factor IX family processes and ensure forms and ensure cleaves and can be vorticed to an adversarial and an analysis and an analysis and an analysis of the same specificative as factor IX family processes and can be restricted by the processes and can be restricted by the processes and can be restricted by the processes and can be surfaced by the surfaced by the processes and can be surfaced by the processes and can be surfaced by the processes and can be surfaced by the pr

The would be allowed the standagene (T). Alternatively the muleic acid constitute, comprises at least one HRE and a transgene where one of the HREs is not functionally linked to the transgene, where one of the HREs is not functionally linked to the transgene, where one of the HREs is not functionally linked to the transgene, or the constructs can be used to up-regulate to rdown-regulate transgene, the constructs preferably comprise a transgene which encodes a protein which is lacking in a variety of general cisorders or involved in conditions related in inappropriate responses to hormones, for example hormone-dependent cancer. The transgene may also be used to replace a defective gene cancer. The transgene has also be used to replace a defective gene cancer. The transgene has also be used to replace a defective gene cancer. The transgene has hamen clotting account to an organism or to a cellular system. The constructs have applications in gene therapy for transfere. The organism or to a cellular system. The constructs have applications in gene therapy for transfere may be constructed advantage of this system is that the hormone-teceptor complex contains a hormone receptor that becomes activated after binding off its appecific hormone. The hormone receptor in the activated state is also also also and a hormone receptor that becomes activated after binding off the preconsile.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 element. The presence of the hormone responsive element on the nucleic and carrying a transpene encourages binding of a nucleic and carrying a transpene encourages binding of a nucleic and the activated hormone receptor complex. Thus the activated hormone receptor acts as a link between the nucleic acid carrying the transgene and the hormone known to interact with the cell membrane.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New nucleic acid constructs are described which comprise an hormone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; haemostatic; coagulant; blood clotting factor; factor VIII; factor IX; therapy; haemophilia A.
                                                                                                                                                                                                                                                                                                                                                               Novel nucleic acid construct useful in gene therapy comprising an normone responsive element and transgene in which the hormone responsive element is not functionally linked to the transgene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

The invention relates to unitates and sequences which regulate game expression in an age-related manner and/or in a livering regulatory sequences are regions of the human factor. If hirty game, and regulatory sequences regions of the human factor. If hirty game, and regulatory sequences are equal to the first age-related regulatory sequences are designated ABS' (AFF6016) and ABS' (AFF6017) and are found in the 5' CT UTR (at position 1264-1265 of AFF6016) are appectively. These alements act synergistically conformed hirty levels over the lifespan of an individual, however, they can independently exert effects on hirty and an individual, however, they can independently exert effects on hirty and an individual, however, they can independently exert effects on hirty and an individual, however, they can independently exert effects on hirty and an individual, however, they can independently exert effects on hirty and an individual, however, they can independently exert effects on hirty and an individual, however, they can independently and contains two PBA-3 (bolyona virus activator 3) elements (AFF60013), and contains two PBA-3 (bolyona virus activator 3) elements of the invention, along with their homelogues, variants and fragments may be used in the construction of recombinant expression vectors include those encoding proceins involved in blood conjulation (e.g., the pro-ocepulante factor x premeter, the Ty promoter. The analysis of the construction of the construc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           thrombosis cardiovascular disease, diabetes Alzheimer's disease, parkninnes disease, cardiovascular disease, carcer, oseeopoosas, ostecanthricis and demental specifically, they may be used to express factor ix antisense mRNA in the treatment of thrombotic conditions associated with the natural age-related rish in factor IX expression. Transgenic cells or animals that contain vectors of the invention are useful as models of these diseases, in acreening for potential therapeutic agents and for suidals normal processes such as againg and gene expression. Frequents and homologues of age-related regulatory sequences, are useful as probes to detect, isolate or identify other such sequences in samples. The present
                                                                                                                           The invention relates to nucleic acid sequences which regulate gene
            New regulatory elements that control age-related gene expression, useful in gene therapy and for reducing Factor IX expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Length 461;

                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to an improved method for the production of recombinant human blood clotting factors, especially factors VIII and IX. Weing an immortalised cell line stably expressing viral transcription activators and carrying a vector comprising a promoter and a sequence encoding the blood coaquilation factor. The factor VIII mutein or a gene transfer vector is used in the preparation of agents for treating hamonalila, especially hamonabilia a. The present agence is human wild-type factor IX protein snooded by vector for professing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Age-related gene regulation; liver-specific; gene expression; human factor IX; hTX, ABS', AB3', age-regulatable expression construct; antiesnes therapy; gene therapy; thrombosis; cardiovascular disease; diabetes; Alzhamor's disease; Parkinson's disease; osneer; osteoporosis;

Pred. Wo. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

MOI. Gen. Genet. 223:138-147(1990).

1. FURCTOR: Carrier of the growing fatty acid chain in fatty acid constructions carrier of the growing fatty acid chain in fatty acid for the fatty acid is involved in the transfer of long hydroxylated fatty acids to lightd A. Is acylated predominantly with 27-fatty acids to lapid A. Is acylated predominantly with 27-fatty acids to blogonhuse in a construction of the lapid A. Is acylated predominantly with 27-fatty lapid A blogonhuse is transferred from CoA to a specific construction by acys. This modification is essential for acid, acid, the proathetic group.

1. Subcardowerry: Wwwloafs or WETHOD-Electrospray; RANGE-Isoform construction with 4 "phosphopanetheline."

2. SHMIAMITY: COTRAINS 1 ACTL CARRER DOWAIN.

RT Wordpate DNA sequence of a serogroup A strain of Neisseria

RE MILCHIGA 22491."

RE TOWN TOWN RASSE PERLIANS B.G., Permins J. Le can also cleave other RNA substrates such as 4.5 RNA. The Protein Component plays an substrate such as 4.5 RNA. The Protein Component Days and Strain of broadening the substrate specificity of the ribosyne (By similarity).

C. C. The Town of the S. Jaader sequence and broadening the substrate specificity of the ribosyne (By similarity).

C. C. The Town of the TNA protein RNA precurates of a cashivite cleavage of RNA, removing S.—

C. T. SERMINT: Consiste G. a cashivite CNA component (MI or rnpB) and a consistent of the SIMILARITY: BELONGS TO THE RNA PAILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This SWISCHARD antry is copyright.                                    CATALYTIC ACTIVITY: Release of an N-terminal amino acid, Xaa-|-
Xbb-, in which Xaa is preferably Leu, but may be other amino acids
including Pro although not Arg or Lys, and Xbb may be Pro.
CORACTOR: WANAANESE (BY SIMILARITY).

SEVERS ACTIN FILAMENTS
(F-ACTIN) AND BINGS TO ACTIN WONDERS.

-i SUBCELLULAR LOCATION: Cycoplasmic. As root hairs emerges and the microfilament bundles redirect to the outgrowth ADP3 concentrates at the tip of the emerging hair and remains in this position as elongation proceeds
-i-TISSUS SPECIFICITY Expressed in all tissues except pollen.
-i-SIMILARITY: BELOMOS TO THE ACTIN-BINDING PROTEINS ADP PAMILIV.
                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         WEDLINE=98079240; PubMed=9418045;

"Anan C.J., Weede A.G., Hansey P.J.;

"The maize actin-depolymerizing factor, ZmADF3, redistributes to the growing tip of elongating root hairs and can be induced to translocate into the nucleus with actin.";

Pant J. 12.1035-1044(1997).
